Art Unit: 2662

IN THE CLAIMS:

1. (currently amended) A wireless communication system comprising an access point device in communication with a back end device, the access point for wirelessly communicating with a terminal equipment device and the back end device for communicating with a host device, wherein the access point device and the back end device work in conjunction to implement a plurality of protocol layers of a wireless communication protocol for enabling communication between the terminal equipment device and the host device, and

wherein the access point device is operably coupled to forward upper protocol layer information from the wireless protocol message to the back end device over a pre-established communication connection, and wherein the pre-established communication connection is a PPP-over-Ethernet connection.

2. (original) The wireless communication system of claim 1, wherein:

the plurality of protocol layers of the wireless communication protocol comprise a lower protocol layer for sending and receiving protocol messages over a wireless medium and upper protocol layers for generating and processing the protocol messages;

the access point device implements the lower protocol layer, and the back end device implements the upper protocol layers.

3. (currently amended) The wireless communication system of claim 1, wherein the access point device is operably coupled to receive a wireless protocol message from a terminal equipment using the lower protocol layer ~~and forward upper protocol layer information from the wireless protocol message to the back end device over a pre-established communication connection.~~

4. (currently amended) The wireless communication system of claim 2 3, wherein the back end device is operably coupled to receive the upper protocol layer information from the access point device over the pre-established communication connection and process the upper protocol layer information.

Serial No. 09/747436

- 4 -

Art Unit: 2662

5. (currently amended) The wireless communication system of claim 2, wherein the back end device is operably coupled to send upper protocol layer information to the access point device over a pre-established communication connection.
6. (original) The wireless communication system of claim 5, wherein the access point device is operably coupled to receive the upper protocol layer information from the back end device over the pre-established communication connection and transmit a wireless protocol message to a terminal equipment using the lower protocol layer, the wireless protocol message including the upper protocol layer information.
7. (currently amended) The wireless communication system of claim 2, wherein the wireless communication protocol comprises a Bluetooth wireless communication protocol, and wherein the access point device comprises baseband transceiver logic and associated HCI firmware for implementing the lower protocol layer of the Bluetooth wireless communication protocol.
8. (original) The wireless communication system of claim 7, wherein the back end device comprises logic for implementing the upper protocol layers of the Bluetooth wireless communication protocol.
9. (original) The wireless communication system of claim 8, wherein the back end device further comprises logic for implementing additional state-based services.
10. (original) The wireless communication system of claim 1, wherein the access point device and the back end device are operably coupled to exchange upper protocol layer information over a pre-established communication connection.
11. (original) The wireless communication system of claim 10, wherein the access point device comprises logic for establishing the communication connection to the back end device.

Serial No. 09/747436

- 5 -

Art Unit: 2662

12. (original) The wireless communication system of claim 10, wherein the back end device comprises logic for establishing the communication connection to the access point device.
13. (original) The wireless communication system of claim 10, wherein the access point device and the back end device communicate over a local area network, and wherein the pre-established communication connection is a logical connection over the local area network.
14. (currently amended) The wireless communication system of claim 13, wherein the local area network is an Ethernet local area network, ~~and wherein the pre-established communication connection is a PPP over Ethernet connection.~~
15. (currently amended) An access point device for use in a wireless communication system, the access point device comprising:
- a wireless interface implementing a lower protocol layer of a wireless communication protocol for exchanging wireless communication messages with a terminal equipment device;
 - a back end interface for communicating with a back end device that implements upper protocol layers of the wireless communication protocol on a pre-established PPPoE communication connection;
 - and
 - forwarding logic operably coupled to receive upper protocol layer information over one of said wireless interface and said back end interface and forward the upper protocol layer information over the other of said wireless interface and said back end interface.
16. (original) The access point device of claim 15, wherein the forwarding logic is operably coupled to receive over the wireless interface a wireless communication message including the upper protocol layer information and forward over the back end interface a communication message including the upper protocol layer information.

Serial No. 09/747436

- 6 -

Art Unit: 2662

17. (original) The access point device of claim 16, wherein the communication message forwarded over the back end interface comprises a PPP/PPPoE communication message including the upper protocol layer information.

18. (original) The access point device of claim 15, wherein the forwarding logic is operably coupled to receive over the back end interface a communication message including the upper protocol layer information and forward over the wireless interface a wireless communication message including the upper protocol layer information.

19. (original) The access point device of claim 18, wherein the communication message received over the back end interface comprises a PPP/PPPoE communication message including the upper protocol layer information.

20. (original) The access point device of claim 15, wherein the wireless communication protocol comprises a Bluetooth wireless communication protocol.

21. (original) The access point device of claim 20, wherein the lower protocol layer comprises a Bluetooth lower protocol layer.

22. (original) The access point device of claim 20, wherein the upper protocol layers comprise a Bluetooth upper protocol layer.

23. (currently amended) A computer program for operating an access point device in a wireless communication system, the computer program comprising:

wireless interface logic implementing a lower protocol layer of a wireless communication protocol for exchanging wireless communication messages with a terminal equipment device over a wireless interface;

back end interface logic for communicating with a back end device that implements upper protocol layers of the wireless communication protocol on a pre-established PPPoE communication connection;

Serial No. 09/747436

Art Unit: 2662

and

forwarding logic programmed to receive upper protocol layer information using one of said wireless interface logic and said back end interface logic and forward the upper protocol layer information using the other of said wireless interface logic and said back end interface logic.

24. (original) The computer program of claim 23, wherein the forwarding logic is programmed to receive over the wireless interface using the wireless interface logic a wireless communication message including the upper protocol layer information and forward over the back end interface using the back end interface logic a communication message including the upper protocol layer information.

25. (original) The computer program of claim 24, wherein the communication message forwarded over the back end interface comprises a PPP/PPPoE communication message including the upper protocol layer information.

26. (original) The computer program of claim 23, wherein the forwarding logic is programmed to receive over the back end interface using the back end interface logic a communication message including the upper protocol layer information and forward over the wireless interface using the wireless interface logic a wireless communication message including the upper protocol layer information.

27. (original) The computer program of claim 26, wherein the communication message received over the back end interface comprises a PPP/PPPoE communication message including the upper protocol layer information.

28. (original) The computer program of claim 23, wherein the wireless communication protocol comprises a Bluetooth wireless communication protocol.

29. (original) The computer program of claim 28, wherein the lower protocol layer comprises a Bluetooth lower protocol layer.

Serial No. 09/747436

- 8 -

Art Unit: 2662

30. (original) The computer program of claim 28, wherein the upper protocol layers comprise a Bluetooth upper protocol layer.

31. (currently amended) A back end device for use in a wireless communication system/the back end device comprising:

upper protocol layer logic implementing upper protocol layers of a wireless communication protocol; and

an access point interface for exchanging upper protocol layer information with an access point device on a pre-established PPPoE communication connection wherein the access point ~~that~~ receives wireless communications from a terminal equipment device and implements a lower protocol layer of the wireless communication protocol.

32. (original) The back end device of claim 31, wherein the upper protocol layer logic is operably coupled to receive over the access point interface a communication message including upper protocol layer information and process the upper protocol layer information.

33. (original) The back end device of claim 32, wherein the communication message received over the access point interface comprises a PPP/PPPoE communication message including the upper protocol layer information.

34. (original) The back end device of claim 31, wherein the upper protocol layer logic is operably coupled to send over the access point interface a communication message including upper protocol layer information.

35. (original) The back end device of claim 34, wherein the communication message sent over the access point interface comprises a PPP/PPPoE communication message including the upper protocol layer information.

Serial No. 09/747436

- 9 -

Art Unit: 2662

36. (original) The back end device of claim 31, wherein the wireless communication protocol comprises a Bluetooth wireless communication protocol.

37. (original) The back end device of claim 36, wherein the lower protocol layer comprises a Bluetooth lower protocol layer.

38. (original) The back end device of claim 36, wherein the upper protocol layers comprise a Bluetooth upper protocol layer.

39. (currently amended) A computer program for operating a back end device in a wireless communication system, the computer program comprising:

upper protocol layer logic implementing upper protocol layers of a wireless communication protocol; and

access point interface logic for exchanging upper protocol layer information with an access point device on a pre-established PPPoE communication connection, wherein the access point device ~~that~~ receives wireless communications from a terminal equipment device and implements a lower protocol layer of the wireless communication protocol over an access point interface.

40. (original) The computer program of claim 39, wherein the upper protocol layer logic is programmed to receive over the access point interface using the access point interface logic a communication message including upper protocol layer information and process the upper protocol layer information.

41. (original) The computer program of claim 40, wherein the communication message received over the access point interface using the access point interface logic comprises a PPP/PPPoE communication message including the upper protocol layer information.

Serial No. 09/747436

- 10 -

Art Unit: 2662

42. (original) The computer program of claim 39, wherein the upper protocol layer logic is programmed to send over the access point interface using the access point interface logic a communication message including upper protocol layer information.

43. (original) The computer program of claim 42, wherein the communication message sent over the access point interface using the access point interface logic comprises a PPP/PPPoE communication message including the upper protocol layer information.

44. (original) The computer program of claim 39, wherein the wireless communication protocol comprises a Bluetooth wireless communication protocol.

45. (original) The computer program of claim 44, wherein the lower protocol layer comprises a Bluetooth lower protocol layer.

46. (original) The computer program of claim 44, wherein the upper protocol layers comprise a Bluetooth upper protocol layer.
